

## SLO - Service level Objective.

- ① Service level Availability
- ② Single Request
- ③ Response time level.
- ④ Synthetic SLO
- ⑤ Synthetic Step SLO

### ① Service level Availability:-

You will define the SLO on the service level.

### ② Single Request:-

- ① Need the SLO for the specific request Type.

✓ SLO  $\rightarrow$  99.5%  $\rightarrow$  Service should be up & running.

30min  
inc. month.

Error Budget  $\rightarrow$  0.5%  
 $\rightarrow$  Can be done by [Technical | patching | upgrade]

Burn rate  $\rightarrow$  10% 30min  
 20% 1

### ③ Response level SLO:- Dynamic Rep. $\rightarrow$

\* Network zone:- Group the endpoint on the basis of Active IP etc.

w/o network zone.

With Network zone.

- ① Unnecessary Interconnection AGs will be avoided.
- ② Efficient.
- ③ Scalable
- ④ Secure
- ⑤ fallback mechanism.

/bin/bash Dynatrace-ActiveGate-Linux-x86-1.313.24.sh --set-network-zone=AG1

### \* Management Zone:-

\* BPJ

Node  
Host = 500  
DB = 5

\* LOTUS

Host = 20  
DB = 7

\* SKYPE

Host = 130  
DB = 12

Total = 200 Host, 24 DB

Host → list of Host

logical segregation of ~~Application~~ (Monitoring Service)

Purepathi-

full-end-to-end execution trace of a transaction or request across entire stack.

- Browser → webservice → service → database
- ① end-to-end tracing
  - ② Code level Visibility → Method-level execution with time, 4Aps.
  - ③ AI root Cause Analysis → Dan's AI
  - ④ Drilldown Support → View logs, metrics, code, errors.
  - ⑤ Captured Automatically → No Code change in one Agent.

Ex →

Use case.

- ① High response time - Method or Query causing delay.
- ② Intermittent error - Pinpoint exception forging service.
- ③ AI slows down reported by user - Slow DB, Service slow.
- ④ Debugging asynchronous flow → Query & Async service Behaviour.
